TYPE 2251, 2252, 2253, 2254

Beomaster Terminal
TYPE 2035

EXPLANATION TO DIAGRAM

Because of the large number of internal connections in the set the wire connections have been gathered into »bundles« in the diagram. The individual wire is provided with codes indicating where they lead to.

INTERNAL CONNECTION ON A DIAGRAM PAGE

indicating by two identical letters (capital or small).

CONNECTION TO ANOTHER DIAGRAM PAGE

indicated by a letter (capital or small) and a diagram (D) number or by a small and a capital letter together with a diagram (D) number.

GROUND SYMBOLS

Two different ground symbols are used in the set.

CO-ORDINATE NUMBERS

The biggest PC boards are provided with co-ordinate systems. The components on these PC boards are provided with a co-ordinate number on the diagram (smaller printing type than the position numbers) indicating in which co-ordinate they are placed on the PC board.

MEASURING CONDITIONS

All DC voltages are measured relative to ground with voltmeter (inner resistance 10 Mohms).
DC voltages are stated in volts (V), ex.: 0.7 V and are measured in position P at 104 MHz without signal and volume in step 0.
Oscillograms in the remote control receiver are measured with a signal transmitted from the control module at a distance of approx. 0.5 m.
Signal paths are shown for FM, remote control, and for AF right channel.
Mechanical switches are shown in neutral position.

ADJUSTMENT OF NO-SIGNAL-CURRENT

Adjust no-signal-current with receiver cold and volume control turned down.
SPEAKERS MUST NOT BE CONNECTED.
With 9R134 (9R234) adjust to 22 mV DC measured across 9R143 and 9R144, TP100/TP101 (9R243 and 9R244, TP200/TP201), or adjust to 50 mA in collector of 9IC103 (9IC203).

Symbol for safety resistors

When replacing components with this symbol use the same type and the same values for ohms and watts. The new components is to be mounted in the same way as the replaced.

17	Socket Panel	3391577	

GUIDE TO ADJUSTMENTS

In the following adjustments references are made to some test points (TP). It is pointed out that in a number of receivers manufactured these test points are not shown on the component print of the PC-units.

In those cases where identical adjustments are to be made for the right-hand and for the left-hand channels, the following applies: Component nominations without brackets indicate the right-hand channel whereas component nominations in brackets refer to the left-hand channel.

Adjustments indicated by a * are accessible through the bottom plate of the set (this, however, does not apply to the initially produced sets).

No-Load Current

No-load current adjustments are to be made while the receiver is in a cold state and with the volume control turned down. Loudspeakers must not be connected.

Connect a DC millivoltmeter across the two emitter resistors 9R143/9R144 (9R243/9R244) in TP100/TP101 (TP200/TP201). Adjust with 9R134 (9R234) until a reading of 22 mV is obtained.

It is also possible to make this adjustment by inserting a milliammeter in series with the collector of 9IC103 (9IC203) and adjust until a reading of 50 mA is obtained.

Offset Output Amplifier

Make these adjustments with the volume control turned down and after the receiver has been ON for at least 30 seconds. Adjust with 9R110 (9R210) until a reading of 0V (± 5 mV) on the loudspeaker output.

Tuning Voltage

Bottom:
Activate P and set P MANUAL TUNING to 87.5 MHz. Connect a DC voltmeter to 8TP19. Adjust 8R66 until a reading of 3.55V is obtained.

Top:
Set P MANUAL TUNING to 108 MHz. Adjust 8R64 until a reading of 19.7V is obtained in 8TP19.

Tuner and IF-Section

Set P MANUAL TUNING to 87.5 MHz.

Tuner/IF

Connect a sweep generator to the aerial input and set it to 87.5 MHz.
Connect an oscilloscope to 8TP11 via an RC-probe.
Adjust with 8L2, 8L3, 8L4, 8L5 and 8L7 for maximum and symmetrical IF-curve (repeat this procedure, if necessary).

Now set the receiver and the sweep generator to 108 MHz. Adjust with the potentiometers 8R1, 8R2, 8R3 and 8R4 for maximum and symmetrical IF-curve.

Detector

Among the instruments to be used in order to make a correct adjustment of the detector, a distortion meter is required as described in point 1. If a distortion meter is not available, it is possible to make a fairly good adjustment by following the procedure described in point 2.

1. Set the receiver to, e.g. 94 MHz.

Connect a combination signal generator/sweep generator to the aerial input and set it to yield 1 mV EMF, $\Delta \pm 75$ kHz.
Set the frequency of the signal generator to 94 MHz and to minimum the 2nd harmonic of the signal (see diagram).

Connect a distortion meter to the loudspeaker output.
Connect a DC voltmeter between 8TP13 and 8TP12.
Adjust with 8L8 until the minimum distortion is measured.
Next adjust with 8L9 until a reading of 0V is obtained.
Repeat both adjustments until they are OK.

2. Make the adjustment by means of the »S-curve«, but it will always remain uncertain whether the receiver is within its distortion data.

Set the receiver to, e.g. 94 MHz.
Connect a combination signal generator/sweep generator to the aerial input and set it to yield 1 mV EMF, $\Delta \pm 75$ kHz.
Set the frequency of the signal generator to 94 MHz and to minimum the 2nd harmonic of the signal (see diagram).

Set the generator to sweep.

Connect an oscilloscope to 8TP14 and connect a DC voltmeter between 8TP13 and 8TP12.

Adjust with 8L8 and 8L9 for maximum and symmetrical S-curve.

Adjust with 8L9 until a reading of 0V is obtained.

FM-AF Output

Connect a signal generator to the aerial input and set it to, e.g. 94 MHz and to yield 1 mV EMF, $\Delta \pm 75$ kHz.

Set the receiver to the same frequency as the signal generator and in the MONO mode.

Connect an AC voltmeter to 8TP24.

Turn 8R202 fully up.

Adjust 8R47 until a reading of 0.7V is obtained.

Connect an AC voltmeter to 8TP23 and note the voltage reading.

Reconnect the AC voltmeter to 8TP24 and adjust 8R202 until the same voltage is measured in 8TP24 as in 8TP23.

* (By the way, 8R102 (8R202) are adjustable to an output level as required by the customer).

AGC

Connect a signal generator to the aerial input and set it to, e.g. 94 MHz and to yield 1 mV EMF, $\Delta \pm 75$ kHz.

Set the receiver to the same frequency as the signal generator.

Connect a DC voltmeter to 8TP10.

Adjust with 8R42 until a reading of 3.5V (± 0.2 V) is obtained.

Signal Strength Indicator

Connect a signal generator to the aerial input and set it to, e.g. 94 MHz and to yield 1 mV EMF, $\Delta \pm 75$ kHz.

Set the receiver to the same frequency as the signal generator.

Adjust 6R11 until the top red LED is just glowing.

Opening of Stereo Decoder

Connect a signal generator to the aerial input and set it to, e.g. 94 MHz and to yield 25 μ V EMF, $\Delta \pm 75$ kHz.

Set the receiver to the same frequency as the signal generator.

Connect a DC voltmeter to 8TP22.

Adjust with 8R43 until a reading of 0.6V is obtained.

Note: The channel separation will then be 10 dB (± 2 dB).

Stereo Decoder

In order to make this adjustment correctly a frequency counter is required or a Bang & Olufsen Voltmeter RV11 and a Frequency Probe PF5, as described in point 1. If these instruments are not available, a fairly good adjustment is possible by following the procedure as described in point 2.

1. Solder a 220 kohm resistor from the base of 8TR14 to +15V.
Tune the receiver to a MONO station.
Connect a frequency counter (or RV11/PF5) to 8TP16.
Adjust with 8R76 until a reading of 19 kHz ± 50 Hz is obtained.
After the adjustment is finished, remove the soldered-on resistor.

2. Solder a 220 kohm resistor from the base of 8TR14 to +15V.
Tune the receiver to a STEREO station.
Turn the potentiometer 8R76 anti-clockwise (as seen from the component side) until the stereo effect just ceases to be heard. Then turn 8R76 clockwise until the stereo effect just ceases to be heard. Now adjust 8R76 exactly between the two positions and an approximately correct adjustment has been achieved.
After the adjustment is finished, remove the soldered-on resistor.

Channel Separation

Connect a stereo encoder to the aerial input.
Connect a wattmeter or an AC voltmeter to the loudspeaker output.
Adjust with the potentiometer 8R79 until minimum signal is achieved in the unmodulated channel.

FM Light Balance

- * 1. Balance.
Connect a DC voltmeter between 8TP12 and 8TP13.
Tune to a station and adjust to 0V between 8TP12 and 8TP13.
Adjust 6R3 until equal light strength is obtained in the two balance arrows.
2. Strength.
Connect a DC voltmeter to the collector on 6TR9, and adjust 6R51 until a reading of 7.5V is obtained on the collector of 6TR9.

Volume Control

Connect a DC voltmeter across the motor with 0 on 5TP20 and plus on 5TP21.

1. Volume step 0:

By activating step 30 and then step 0 respectively, adjust 6R25 until the motor bottoms the volume potentiometer at step 0. (In the 0 position the voltage across the motor must be between 0 and +1V).

2. Preset volume 0:

Activate reset.

By regulating the Preset volume potentiometer towards max. and 0 respectively, adjust 6R24 until the motor bottoms the volume potentiometer at position 0.

(In the 0 position the voltage across the motor must be between 0 and +1V).

After Preset volume 0, check step 0.

★ 3. VΛ volume speed:

While activating VΛ, adjust 6R32 until the voltage across the motor is 6.5V or to a motor speed as required by the customer.

Reset

During this adjustment, pay attention to static electricity.

Make this adjustment without having the receiver connected to the mains.

Remove P5 on module 2.

Connect a variable DC power supply with - to chassis and + to pin 3-4 on P5.

Set the power supply to yield +4.6V (voltmeter controlled).

Set an oscilloscope in DC mode and connect it across 2R95.

Adjust 2R89 until a reading of $2.3V \pm 1V$ is obtained across 2R95.

Please note that this adjustment is extremely sensitive.

ELECTRICAL DESCRIPTION
Silent Tuning

8IC2

Pin 13: Rising signal strength = rising potential

Falling signal strength = falling potential

Pin 12: On sideband = high. On station and noise = low.

MANUAL in ON position.

8TR7 is ON at strong signals and pulls the base of 8TR8 down. 8TR8 is OFF and a path is opened to chassis from pin 5 on 8IC2 via 8R56, 8R57 and 8R58 which results in signal passage.

When the signal has dropped to a certain level, 8TR7 goes OFF and 8TR8 goes ON. Pin 5 on 8IC2 goes high, and the signal is being muted.

Pin 12 on 8IC2 is high if you tune away from a station while tuning on the side band. When pin 12 is high, 8TR6 goes ON.

This raises the level on the emitter of 8TR7, and 8TR7 goes OFF. 8TR8 goes ON and the signal is being muted.

When MANUAL is in OFF position, a path is opened to chassis from pin 5 on 8IC2, and all types of signals will pass.

Tuning and AFC

Tuning can be made with the P MANUAL TUNING wheel or with one of the six pre-set programmes.

The tuning system is supplied from +32V via a constant-current generator. The bottom voltage is adjustable with 8R66 and the top voltage with 8R64.

AFC

The base of 8TR10 is connected to pin 10 of 8IC2 which has a stable DC voltage of approx. 5.6V. When the AFC is engaged (FM AUTO) the base of 8TR11 is connected to pin 7 of 8IC2.

When the receiver is tuned accurately to a station, the voltage on pin 7 of 8IC2 is also approx. 5.6V. When tuning down from the centre of the station the voltage on pin 7 of 8IC2 will be falling. The current in 8TR11 will be falling and the voltage on its collector will be rising. The tuning voltage will also be rising and the station will be pulled in until pins 7 and 10 of 8IC2 are again in balance. When tuning up from the centre of a station the voltage on pin 7 of 8IC2 will be rising, the tuning voltage will be falling and the station will be pulled in accurately.

The holding range of the AFC is ± 200 kHz.

When the AFC is OFF, pin 7 of 8IC2 is drifting and the bases of 8TR10 and 8TR11 are short-circuited via 8R48.

Fault Switch

The function of the circuit is to protect connected loudspeakers against overloads at faults in the output amplifier and to protect the output amplifier thermally at too high loads.

A voltage swing (a signal) on the output will charge 9C122 to a negative voltage via 9D111, 9C123, 9D110, and the resistor 9R157 which is limiting the charging.

Current through the emitter resistors will result in a voltage drop across the latter.

This voltage drop will charge 9C122 to a positive voltage through 9R153 or the emitter on 9TR112 to a negative voltage.

This negative and positive charging of 9C122 will during normal operation (8 ohm load) neutralize each other with the result that 9TR112 is not forward biased. The base-emitter voltage on 9TR112 will appear from the below table under varying operational conditions.

Output load	Voltage swing	Current	Base-emitter voltage on 9TR112
8 ohm	small	small	0
none	small	none	negative
2 ohm	small	high	+0.6 V after some time at high strength
short-circuited	none	high	+0.6 V instantaneously

When 9TR112 is forward biased, the base on 9TR1 is pulled low. 9TR1 and thus 9TR2 will go ON, pin 19 on the microcomputer will be pulled low, and the receiver will go in ST.BY mode.

A PTC resistor (9R2) is used to protect the cooling grill against overheating. It is fitted adjacent to the grill. With rising temperatures the resistance in 9R2 will also rise. When the resistance of 9R2 has reached a certain level, 9TR1 and thus 9TR2 will go ON, and the receiver is in ST.BY mode.

FM Frequency Counter

The FM oscillator frequency is being counted by the microcomputer which internally subtracts the intermediate-frequency ratio from the oscillator frequency with the result that the correct aerial frequency can be read out on the display.

Via 2L14 (which ensures galvanic separation between tuner and counter frequency) the oscillator frequency is transferred to 2IC8. 2IC8 has the dual function of amplifier and sub-divider. Sub-division is necessary since the microcomputer cannot count frequencies above 500 kHz. After amplification and division by 64 in 2IC8 the frequency is further amplified in 2TR12 and applied to 2IC9.

In 2IC9 the frequency is further divided by 8 in 3 trailing-edge flip-flop units so that totally it is divided by 512. The frequencies which are applied to the frequency of the microcomputer may vary from 192 kHz to 232 kHz.

Reset

In order to inhibit the microcomputer from locking to a random internal program during start-up of the power supply or after a mains dropout of a duration of more than 1 second (cf. microcomputer power back-up), the above circuit has been incorporated.

During normal operation 2TR5 and thus 2TR6 are ON and pin 39 on 21C4 is HIGH. If the 5V power supply is dropping, 2TR5 and 2TR6 will go OFF when the voltage has dropped to 4.67V. At 4.67V the microcomputer will lock-out the program it is processing at the moment and it will remain locked until the voltage has dropped down to the undefined range of the microcomputer lower than 4.5V, typically 3-3.5V. At rising voltage the microcomputer will be operational when the voltage reaches 4.5V, but nothing will happen until the voltage reaches 4.67V which is when 2TR5 and 2TR6 will go ON, pin 39 on the microcomputer will go HIGH and it will be reset. After the reset the microcomputer will run through its start-up routine and go in ST. BY mode.

The circuit can be adjusted by means of 2R89.

It is possible to reset the microcomputer manually by for a short while to short-circuit the points marked TEST RESET.

The 5R6 (VOLUME SLAVE) potentiometer is integral with the volume potentiometer and, consequently, it is also driven by 5M1.

In, for instance, ST. BY mode all outputs on 6IC6 are high except pin 9 which is low. If the lever on 3R4 (PRESET VOLUME) potentiometer is in its bottom position, the voltage on the anode of 6D5 is clamped to chassis via 6R27, 6R24 and 6IC6. Then 5M1 is in »down volume«, the lever on 5R6 in the bottom position and the voltage of the anode of 6D4 is clamped to chassis via 6R25, 6R53 and 6TR7.

If the lever on 3R4 is moved upwards, the voltage on the anode of 6D5, and thus pins 6 and 8 on 6IC5, will rise towards 15V.

Since the voltage on the anode of 6D4 is low, pins 7 and 9 on 6IC5 will also be low. This will have the consequence that pin 13 on 6IC5 will be chassis going and pin 2 will be positive-going and the voltage across the motor will rise to a potential where the motor will begin to run, the lever on 5R6 will be pulled upwards and pins 7 and 9 on 6IC5 will be positive-going. If the lever on 3R4 is stopped, the motor will continue to run until the voltage on pins 7 and 9 on 6IC5 has reached a level where the outputs pins 2 and 13 are in balance with the consequence that the voltage across the motor will drop so much that the motor will stop.

In principle, turning the volume down takes place in the same way as turning it up with the only difference that the voltage on pins 6 and 8 on 6IC5 will be decreasing and that pins 7 and 9 will have positive weight with the consequence that the voltage across the motor is reversed in relation to turning the volume up.

When pressing one of the volume step buttons the appropriate output on 6IC6 will go low while all other outputs on 6IC6 will remain high. When pin 9 on 6IC6 is high, the setting 3R4 has no influence on the regulation.

In principle, the step regulation is made in the same way as the PRESET regulation with the only difference that the voltage division between 6R47 and 6R41, 42, 43, 44, 45, 46 respectively will replace 3R4. The approximate voltages for the various steps (measured on the cathode of 6D8) will appear from the below table.

STEP	VOLT
0	1
10	5
20	7
30	8,8
40	10
50	11,5
60	15

VΛ Adjustment

When pressing for instance Λ, pin 11 on 6IC6 will go low while all other outputs and the input on pin 12 will go high. When pin 12 goes high, the base bias of 6TR7 will be shorted to chassis, and the setting of 5R6 will have no influence. With a low level on pin 11 on 6IC6, a path is opened between pins 8 and 6 on 6IC5 and chassis via 6R38. Likewise, a path is opened between pins 9 and 7 to chassis via 6R33 and 6R32 which combined make up a greater resistance than 6R38. This will have the consequence that pins 9 and 7 on 6IC5 have positive weight relative to pins 8 and 6 and that 5M1 will turn the volume up with a speed which is adjustable with 6R32. When the Λ button is no longer pressed, pin 11 on 6IC6 will go high, the circuit will balance out and 5M1 will stop.

The V adjustment is made in the same way as Λ with the only difference that it is pin 10 on 6IC6 which goes low.

DISMANTLING

Opening-up of the Receiver (Service position)

Remove the screw covers and loosen the two screws. The top part can now be lifted and put into service position.

Power Supply and Output Amplifier

Put the receiver into service position.

Loosen screws A and remove screws B.

The cooling grill may now be removed.

Loosen screws C and remove the two screws on top of PC16. The power supply may now be removed.

Loosen screws D and the output amplifier PC9 can be removed.

The foam block placed over the electrolytic capacitors of the power supply may be used as support during measurements in the output amplifier. The whole component side will then be accessible for measurements.

Operating Panel

Loosen the 3 locking pins with a fine screwdriver after which the operating panel can be lifted at the front edge and pulled upwards.

Dial Glass Plate

Push the decorative profile between the glass plate and the operating panel to the right and remove it. Lift the glass plate at the front edge and pull it outwards.

Programme Lid and Secondary Operating Panel

With the top part in the service position the 3 locking pins can be loosened with a screwdriver, and the panel with lid can be pulled up.

REMEMBER: The pushbuttons on FM and Loudness Switch are loose.

Socket 3P43 must be removed if the panel is removed altogether.

Aluminium Cover Plate

Place the receiver at the edge of a table.

Loosen the top part and pull it forward so that the 2 screws are accessible from below. Loosen the screws and lift the aluminium plate up at the side at the eject rail and pull backwards.

Note: If the receiver has not been dismantled, the screws can be loosened through holes in the bottom plate.

Socket Panel

Set the top part into service position, remove the cooling grill and lift up the output amplifier. The 4 screws can now be removed.

Place the receiver on its rear edge and pull the output amplifier upwards.

The socket panel can now be removed downwards.

For replacement of DIN and FM sockets the terminals at the rear of the PC plate can be de-soldered and the socket clipped loose through the holes in the angle.

TECHNICAL SPECIFICATIONS	BEOMASTER 6000
Type no.	2251-2252-2253-2254
Standard for measurements	IHF
Continuous power output per channel	75 watts at 8 ohms
Rated bandwidth	20-20,000 Hz
Total harmonic distortion	<0.08%
Dynamic headroom	0.7 dB
IHF intermodulation	<0.05%
Response vs frequency:	
Phono	20-20,000 Hz \pm 1.5 dB
Tape	20-20,000 Hz \pm 1.5 dB
Wideband damping factor	60
Input sensitivity/Impedance:	
Phono	0.22 mV/47 kohms
Tape	22 mV/200 kohms
Line	500 mV/15-47 kohms (at specified power output)
Overload level:	
Phono	80 mV
Tape	8 V
Signal-to-noise ratio:	
A-weighted phono	>75 dB
A-weighted tape	>78 dB
Channel separation	50 dB
Output:	
Tape	530 mV/1 kohms
Line	500 mV/1 kohms
Headphones	Max. 14 V/200 ohms
Bass control at 40 Hz	\pm 11 dB
Treble control at 12,500 Hz	\pm 11 dB
FM range, type 2251-2252-2253	87.5 - 108 MHz
FM range, type 2254	76.9 - 88.7 MHz
FM aerial impedance	75 and 240 ohms
Usable sensitivity mono	15 dBf - 1.5 μ V/75 ohms
Usable sensitivity stereo	17 dBf - 2 μ V/75 ohms
50 dB quieting sensitivity mono	21 dBf - 3 μ V/75 ohms
50 dB quieting sensitivity stereo	40 dBf - 28 μ V/75 ohms
Signal-to-noise ratio at 65 dBf mono	77 dB
Signal-to-noise ratio at 65 dBf stereo	71 dB
Stereo channel separation at automatic channel blend	40 dB
Frequency response	20-15,000 Hz \pm 1 dB
Distortion at 65 dBf mono	0.2%
Distortion at 65 dBf stereo	0.3%
Intermodulation distortion mono	0.02%
Intermodulation distortion stereo	0.18%
Capture ratio	1.8 dB
Adjacent channel selectivity	6 dB
Alternate channel selectivity	65 dB
Spurious response	110 dB
Image response ratio	86 dB
IF response ratio	120 dB
AM suppression	63 dB
Subcarrier product rejection	72 dB
Power supply	type 2251 220 volts
	type 2252 240 volts
	type 2253 120 volts
	type 2254 100 volts
Power frequency	50-60 Hz

INSULATION TEST

Insulation Test for Beomaster 6000

Each receiver **must** be insulation tested after having been dismantled. The test is to be made when the receiver has been reassembled completely and is ready for delivery to the customer.

Make the insulation test as follows:

Short-circuit the two plug pins of the mains plug and connect them to one of the terminals of the insulation tester. Connect the other terminal of the insulation tester to the chassis screw which is to be found above the loudspeaker sockets at the rear of the receiver.

NOTE!

To avoid ruining the receiver it is essential that both insulation tester terminals are in really good mechanical contact.

Now turn slowly the voltage control of the insulation tester until a voltage of 1.5-2 kV is obtained. Hold it there for 1 second, then turn the voltage down again slowly.

The terminals of the insulation tester may now be disconnected.

At no point during the testing procedure any flash-overs are permissible.

FINAL TESTING

By following the below instructions all receiver functions are tested. The sequence in below table **must** be adhered to.

Pre-setting:
 MANUAL
 PRESET VOLUME 0

OPERATION	FEED-BACK	
	DISPLAY	INDICATORS
PUSHBUTTON operation		
Connect to mains	Decimal point (ST. BY)	
P	Follow keying, e.g. 94.4 P	Balance arrows and background for volume scale
PRESET VOLUME to max. and then to 0		Volume scale follows operation
0 10 20 30 40 50 60 √ ^		Volume scale follows operation
RESET		Volume scale to 0
P MANUAL TUNING in outer positions	Minimum 87.5-108.0 P	When station is passed: Field strength, stereo at MPX, balance light follows tuning station
P1 → P6 At the same time test the potentiometers involved	Follows keying e.g. 94.4 P6 Follows regulation	
PH ⇒ TP1 ⇒ TP2	PH ⇒ TP1 ⇒ TP2	
ST. BY (●)	Decimal point	
CLOCK SET	Time from connection e.g. 00:02 (colon flashing)	
Four times 8	88:88 (colon flashing)	
Real time ⇒ OK	Real time ⇒ Decimal point	
P1	Follows keying e.g. 94.4 P1	
FREQ ↓ ↑ two times CLOCK	1. Real time (colon constant) 2. e.g. 94.4 P1	
TIMER 1	00 00 (the two first digits are flashing)	

OPERATION	FEED-BACK	
PUSHBUTTON operation	DISPLAY	INDICATORS
TIMER 2	00 00 (the two rear digits are flashing)	
A random point in time ⇒ OK ⇒ ST. BY	Point in time selected ⇒ e.g. 94.4 P1 ⇒ : .	

Connect:

4 x loudspeaker.

Headphone.

GR 6000 or 8000 to PHONO } DATA LINK

BE 6000 or 8000 to TAPE 1 }

Other BE to TAPE 2.

Make listening test on all programmes.

Test DATA LINK.

Test balance, bass, treble, loudspeaker switches, FM-AUTO (AFC),
MANUAL (silent tuning), MONO, LOUDN ON/OFF and MUTE.

SERVICE TIPS Dial Drive for Volume

Set top part into service position.
Dial drive seen from above.
Volume motor in 0 position.
Dial in 0 position.

Dial cord, index No. 3955035.

Repairs of Volume Dial

Due to flexibility requirements the dial tape for volume must be repaired with tape, index No. 3947099, only.

Dial Drive for FM

Remove Module 04 (Preset).
Turn the tuning potentiometer anti-clockwise all the way.

Dial cord, index No. 3955034.

Replacement of 9TR102/202

At replacements in receivers with serial numbers lower than No. 2421001, a 560 ohm resistor (index No. 5010067) has to be fitted in series with the base. If this resistor is not fitted, the result may be a disharmonic sound in the loudspeakers immediately after activation of ST.BY.

Replacement of Power Supply Transformers

Put the top part into servicing position.
00T1 is accessible.
Remove Module 16 (power supply) and 00T2 becomes accessible.

Survey of Mounting of Wires on Power Supply Transformers

00T1 = 8013258
00T2 = 8013257
Module 11 = 8002462

Type 2251 = 220V

00T1 soldered for 220V

00T2 soldered for 220V

Type 2252 = 240V

00T1 = 8013258

00T2 = 8013257

Module 11 = 8002462

Rear plate label for type 2252 (240V) = 3180889

00T1 soldered for 240V

00T2 soldered for 240V

Type 2253 = 120V

00T1 = 8013271

00T2 = 8013270

Module 11 = 8002506

Rear plate label for type 2253 (120V) = 3180888

00T1 soldered for 120V

00T2 soldered for 120V

Type 2254 = 100V

00T1 = 8013273

00T2 = 8013272

Module 11 = 8002506

Rear plate label for type 2254 (100V) = 3180890

00T1 soldered for 100V

00T2 soldered for 100V

Survey of Wires

Wires from Beomaster 6000 to:	
Beocord with data link (TP1)	6270222 (7 pins – 4 signals, 2 data links)
Tape recorder with RCA phono plugs (TP1)	6270215 (DIN/PHONO, 2 x 2 signals)
Beocord without data link or another tape recorder with 5 pole DIN socket (TP2)	6270212 (PHONO/DIN with attenuator, 2 x 2 signals)
Tape recorder with RCA phono plugs (TP2)	2 off 6270236 (2 signals in each)
Beogram 8000 (PH)	6270213 (7 pins – 2 signals, 2 data links)
Equalizer with RCA phono plugs (External)	6270215 (DIN/PHONO, 2 x 2 signals)
